1 Deskriptive Statistics

1.1 Summary Statistics: Sample

1.1.1 Location

Mode Most frequent value of x_i. Two or more modes are possible (bimodal).

Median

$$\tilde{x}_{0.5} = \begin{cases} x_{((n+1)/2)} & \text{falls } n \text{ ungerade} \\ \frac{1}{2}(x_{(n/2)} + x_{(n/2+1)}) & \text{falls } n \text{ gerade} \end{cases}$$

Quantile

$$\tilde{x}_\alpha = \begin{cases} x_{(k)} & \text{falls } n\alpha \notin \mathbb{N} \\ \frac{1}{2}(x_{(n\alpha)} + x_{(n\alpha+1)}) & \text{falls } n\alpha \text{ ganzzahlig} \end{cases}$$

with

$k = \min x \in \mathbb{N}, \quad x > n\alpha$

Minimum/Maximum

$$x_{\min} = \min_{i \in \{1,\dots,N\}}(x_i) \qquad x_{\max} = \max_{i \in \{1,\dots,N\}}(x_i)$$

Arithmetic Mean

$$\bar{x} = \frac{1}{n}\sum_{i=1}^{n} x_i$$

Estimates the expectation $\mu = E[X]$ (first moment).

Calculation Rules:

- ⋆ $E(a + b \cdot X) = a + b \cdot E(X)$
- ⋆ $E(X \pm Y) = E(X) \pm E(Y)$

Geometric Mean

$$\bar{x}_G = \sqrt[n]{\sum_{i=1}^{n} x_i}$$

For growth factors: $\bar{x}_G = \sqrt[n]{\frac{B_n}{B_0}}$

Harmonic Mean

$$\bar{x}_H = \frac{\sum_{i=1}^{n} w_i}{\sum_{i=1}^{n} \frac{w_i}{x_i}}$$

1.1.2 Dispersion

Range

$$R = x_{(n)} - x_{(1)}$$

Interquartile Range

$$d_Q = \tilde{x}_{0.75} - \tilde{x}_{0.25}$$

(Empirical) Variance

$$s^2 = \frac{1}{n}\sum_{i=1}^{n}(x_i - \bar{x})^2 = \frac{1}{n}\sum_{i=1}^{n} x_i^2 - \bar{x}^2$$

Estimates the second centralized moment.

Calculation Rules:

- ⋆ $Var(aX + b) = a^2 \cdot Var(X)$
- ⋆ $Var(X \pm Y) = Var(X) + Var(Y) + 2Cov(X, Y)$

(Empirical) Standard Deviation

$$s = \sqrt{s^2}$$

Coefficient of Variation

$$\nu = \frac{s}{\bar{x}}$$

Average Absolute Deviation

$$e = \frac{1}{n}\sum_{i=1}^{n}|x_i - \bar{x}|$$

Estimates the first absolute centralized moment.

1.1.3 Concentration

Gini Coefficient

$$G = \frac{2\sum_{i=1}^{n} i x_{(i)} - (n+1)\sum_{i=1}^{n} x_{(i)}}{n \sum_{i=1}^{n} x_{(i)}} = 1 - \frac{1}{n}\sum_{i=1}^{n}(v_{i-1} + v_i)$$

with

$$u_i = \frac{i}{n}, \quad v_i = \frac{\sum_{j=1}^{i} x_{(j)}}{\sum_{j=1}^{i} x_{(j)}} \qquad (u_0 = 0, \quad v_0 = 0)$$

These are also the values for the Lorenz curve.

Range: $0 \leq G \leq \frac{n-1}{n}$

Lorenz-Münzner Coefficient (normed G)

$$G^+ = \frac{n}{n-1}G$$

Range: $0 \leq G^+ \leq 1$

1.1.4 Shape

(Empirical) Skewness

$$\nu = \frac{n}{(n-1)(n-2)} \sum_{i=1}^{n} \left(\frac{x_i - \bar{x}}{s} \right)^3$$

Estimates the third centralized moment, scaled with $(\sigma^2)^{\frac{2}{3}}$

(Empirical) Kurtosis

$$k = \left[n(n+1) \cdot \sum_{i=1}^{n} \left(\frac{x_i - \bar{x}}{s} \right)^4 - 3(n-1) \right] \cdot \frac{n-1}{(n-2)(n-3)} + 3$$

Estimates the fourth centralized moment, scaled with $(\sigma^2)^2$

Excess

$$\gamma = k - 3$$

1.1.5 Dependence

for two nominal variables

χ^2-Statistic

$$\chi^2 = \sum_{i=1}^{k} \sum_{j=1}^{l} \frac{(n_{ij} - \frac{n_{i+} n_{+j}}{n})^2}{\frac{n_{i+} n_{+j}}{n}} = n \left(\sum_{i=1}^{k} \sum_{j=1}^{l} \frac{n_{ij}^2}{n_{i+} n_{+j}} - 1 \right)$$

Range: $0 \leq \chi^2 \leq n(\min(k,l) - 1)$

Phi-Coefficient

$$\Phi = \sqrt{\frac{\chi^2}{n}}$$

Range: $0 \leq \Phi \leq \sqrt{\min(k,l) - 1}$

Cramér's V

$$V = \sqrt{\frac{\chi^2}{\min(k,l) - 1}}$$

Range: $0 \leq V \leq 1$

Contingency Coefficient C

$$C = \sqrt{\frac{\chi^2}{\chi^2 + n}}$$

Range: $0 \leq C \leq \sqrt{\frac{\min(k,l)-1}{\min(k,l)}}$

Corrected Contingency Coefficient C_{corr}

$$C_{corr} = \sqrt{\frac{\min(k,l)}{\min(k,l) - 1}} \cdot \sqrt{\frac{\chi^2}{\chi^2 + n}}$$

Range $0 \leq C_{corr} \leq 1$

Odds-Ratio

$$OR = \frac{ad}{bc} = \frac{n_{ii} n_{jj}}{n_{ij} n_{ji}}$$

Range: $0 \leq OR < \infty$

for two ordinal variables

Gamma (Goodman and Kruskal)

$$\gamma = \frac{K - D}{K + D}$$

$K = \sum_{i<m} \sum_{j<n} n_{ij} n_{mn}$ Number of concordant pairs
$D = \sum_{i<m} \sum_{j>n} n_{ij} n_{mn}$ Number of reversed pairs

Range: $-1 \leq \gamma \leq 1$

Kendall's τ_b

$$\tau_b = \frac{K - D}{\sqrt{(K + D + T_X)(K + D + T_Y)}}$$

with
$T_X = \sum_{i=m} \sum_{j<n} n_{ij} n_{mn}$ Number of ties w.r.t. X
$T_Y = \sum_{i<m} \sum_{j=n} n_{ij} n_{mn}$ Number of ties w.r.t. Y

Range: $-1 \leq \tau_b \leq 1$

Kendall's/Stuart's τ_c

$$\tau_c = \frac{2 \min(k,l)(K - D)}{n^2(\min(k,l) - 1)}$$

Range: $-1 \leq \tau_c \leq 1$

Spearman's Rank Correlation Coefficient

$$\rho = \frac{n(n^2-1) - \frac{1}{2} \sum_{j=1}^{J} b_j(b_j^2 - 1) - \frac{1}{2} \sum_{k=1}^{K} c_k(c_k^2 - 1) - 6 \sum_{i=1}^{n} d_i^2}{\sqrt{n(n^2-1) - \sum_{j=1}^{J} b_j(b_j^2 - 1)} \sqrt{n(n^2-1) - \sum_{k=1}^{K} c_k(c_k^2 - 1)}}$$

or

$$\rho = \frac{s_{rg_x rg_y}}{\sqrt{s_{rg_x rg_x} s_{rg_y rg_y}}}$$

Without ties:

$$\rho = 1 - \frac{6 \sum_{i=1}^{n} d_i^2}{n(n^2 - 1)}$$

with
$d_i = R(x_i) - R(y_i)$ rank difference

Range: $-1 \leq \rho \leq 1$

for two metric variables

Correlation Coefficient (Bravais-Pearson)

$$r = \frac{S_{xy}}{\sqrt{S_{xx} S_{yy}}} = \frac{s_{xy}}{\sqrt{s_{xx} s_{yy}}}$$

with

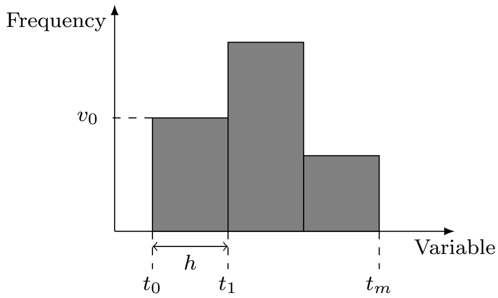
$$S_{xy} = \sum_{i=1}^{n}(x_i - \bar{x})^2(y_i - \bar{y})^2 \quad \text{or } s_{xy} = \frac{S_{xy}}{n}$$
$$S_{xx} = \sum_{i=1}^{n}(x_i - \bar{x})^2 \quad \text{or } s_{xx} = \frac{S_{xx}}{n}$$
$$S_{yy} = \sum_{i=1}^{n}(y_i - \bar{y})^2 \quad \text{or } s_{yy} = \frac{S_{yy}}{n}$$

Range: $-1 \leq r \leq 1$

1.2 Tables

1.3 Diagrams

1.3.1 Histogram



sample: $X = \{x_1, x_2, ...; x_n\}$
k-th bin: $B_k = [t_k, t_{k+1})\,, k = \{0, 1, ..., m-1\}$
Number of observations in the k-th bin: v_k
bin width: $h = t_{k+1} - t_k, \forall k$

Scott's Rule

$$h^* \approx 3.5\sigma n^{-\frac{1}{3}}$$

For approximately normal distributed data (min. MSE)

1.3.2 QQ-Plot

1.3.3 Scatterplot

2 Probability

2.1 Combinatorics

		without replacement	with replacement
Permutations		$n!$	$\frac{n!}{n_1!\cdots n_s!}$
Combinations:	without order	$\binom{n}{m}$	$\binom{n+m-1}{m}$
	with order	$\binom{n}{m}m!$	n^m

with:
$n! = n \cdot (n-1) \cdot ... \cdot 1$
$\binom{n}{m} = \frac{n!}{m!(n-m)!}$

2.2 Probability Theory

Laplace

$$P(A) = \frac{|A|}{|\Omega|}$$

Kolmogorov Axioms mathematical definition of probability

(1) $0 \leq P(A) \leq 1 \quad \forall A \in \mathcal{A}$
(2) $P(\Omega) = 1$
(3) $P(\bigcup_{i=1}^{\infty} A_i) = \sum_{i=1}^{\infty} P(A_i)$
$\forall A_i \in \mathcal{A}, i = 1, ..., \infty$ with $A_i \cap A_j = \emptyset$ for $i \neq j$

Implications:

- $P(\bar{A}) = 1 - P(A)$
- $P(\emptyset) = 0$
- $P(A \cup B) = P(A) + P(B) - P(A \cap B)$
- $A \subseteq B \Rightarrow P(A) \leq P(B)$
- $P(B) = \sum_{i=1}^{n} P(B \cap A_i)$, f'ur $A_i, ..., A_n$ complete decomposition of Ω into pairwise disjoint events

Probability (Mises) frequentist definition of probability

$$P(A) = \lim_{n \to \infty} \frac{n_A(n))}{n}$$

with n repetitions of a random experiment and $n_A(n)$ events A

Conditional Probability

$$P(A|B) = \frac{P(A \cap B)}{P(B)} \qquad \text{für } P(B) > 0$$

$$\Rightarrow P(A \cap B) = P(B|A)P(A) = P(A|B)P(B)$$

Law of Total Probability

$$P(B) = \sum_{i=1}^{n} P(B|A_i)P(A_i)$$

Bayes' Theorem

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)} \quad \text{for } P(A), P(B) > 0$$

Stochastic Independence

$$\text{A, B independent} \Leftrightarrow P(A \cap B) = P(A) + P(B)$$
$$\text{X, Y independent} \Leftrightarrow f_{XY}(x, y) = f_X(x) \cdot f_Y(y) \qquad \forall x, y$$

2.3 Random Variables/Vectors

Random Variables $\in \mathbb{R}$

Definition

$$Y : \Omega \to \mathbb{R}$$

The Subset of possible values for $\mathbb{R}$ is called support.
Notation: Realisations of Y are depicted with lower case letters.
$Y = y$ means, that y is the realisation of Y.

Discrete and Continuous Random Variables
If the support is uncountably infinite, the random variable is called *continuous*, otherwise it is called *discrete*.

- **Density $f(\cdot)$:**

  For continuous variables: $P(Y \in [a, b]) = \int_a^b f_Y(y)dy$

  For discrete variables the density (and other functions) can be depicted like the corresponding function for continuous variables, if the notation is extended as follows: $\int_{-\infty}^{y} f_Y(\tilde{y})d\tilde{y} := \sum_{k:k\leq y} P(Y = k)$. This notation is used.

- **Cumulative Distribution Function $F(\cdot)$:**
  $F_Y(y) = P(Y \leq y)$

Relationship:

$$F_Y(y) = \int_{-\infty}^{y} f_Y(\tilde{y})d\tilde{y}$$

Moments

- **Expectation (1. Moment)**: $\mu = E(Y) = \int y f_Y(y)dy$

- **Variance (2. centralized Moment)**:
  $\sigma^2 = Var(Y) = E(\{Y - E(Y)\}^2) = \int (y - E(Y))^2 f(y)dy$
  Note: $E(\{Y - \mu\}^2) = E(Y^2) - \mu^2$

  Proof:
  $E(\{Y-\mu\}^2) = E(Y^2-2Y\mu+\mu^2) = E(Y^2)-2\mu^2+\mu^2 = E(Y^2) - \mu^2$

- **kth Moment**: $E(Y^k) = \int y^k f_Y(y)dy$,
  k. centralized Moment: $E(\{Y - E(Y)\}^k)$

Moment Generating Function

$$M_Y(t) = \mathrm{E}(e^{tY})$$

with $\left.\frac{\partial^k M_Y(t)}{\partial t^k}\right|_{t=0} = \mathrm{E}(Y^k)$

Cumulant Generating Function $K_Y(t) = \log M_Y(t)$

A random variable is uniquely defined by its moment generating function and vice versa (as long as moments and cumulants are finite).

Random Vectors $\in \mathbb{R}^q$

Density and Cumulative Distribution Function

$$F(y_1, ..., y_q) = P(Y_1 \leq y_1, ..., Y_q \leq y_q)$$

$$P(a_1 \leq Y_1 \leq b_1, ..., a_q \leq Y_q \leq b_q)$$
$$= \int_{a_1}^{b_1} ... \int_{a_q}^{b_q} f(y_1, .., y_q)dy_1...dy_q$$

Marginal Density

$$f_{Y_1}(y_1) = \int_{-\infty}^{\infty} ... \int_{-\infty}^{\infty} f(y_1, ..., y_k)dy_2...dy_k$$

Conditional Density

$$f_{Y_1|Y_2}(y_1|y_2) = \frac{f(y_1, ..., y_2)}{f(y_2)} \text{ for } f(y_2) > 0$$

Iterated Expectation

$$\mathrm{E}(Y) = \mathrm{E}_X(\mathrm{E}(Y|X))$$

Proof:

$$\mathrm{E}(Y) = \int y f(y)dy = \int \int y f(y|x)dy f_X(x)dx = \mathrm{E}_X(\mathrm{E}(Y|X))$$

$$\mathrm{Var}(Y) = \mathrm{E}_X(\mathrm{Var}(Y|X)) + \mathrm{Var}_X(\mathrm{E}(Y|X))$$

Proof:

$$\begin{aligned}
\mathrm{Var}(Y) &= \int (y - \mu_Y)^2 f(y)dy \\
&= \int (y - \mu_Y)^2 f(y|x)f(x)dydx \\
&= \int (y - \mu_{Y|x} + \mu_{Y|x} - \mu_Y)^2 f(y|x)f(x)dydx \\
&= \int (y - \mu_{Y|x})^2 f(y|x)f(x)dydx + \\
&\quad \int (\mu_{Y|x} - \mu_Y)^2 f(y|x)f(x)dydx + \\
&\quad 2\int (y - \mu_{Y|x})(\mu_{Y|x} - \mu_Y)f(y|x)f(x)dydx \\
&= \int \mathrm{Var}(Y|x)f(x)dx + \int (\mu_{Y|x} - \mu_Y)^2 f(x)dx \\
&= \mathrm{E}_X(\mathrm{Var}(Y|X)) + \mathrm{Var}_X(\mathrm{E}(Y|X))
\end{aligned}$$

2.4 Probability Distributions

2.4.1 Discrete Distributions

Discrete Uniform

$$Y \sim \mathrm{U}(\{y_1, ..., y_k\}),\ y \in \{y_1, ..., y_k\}$$
$$P(Y = y_i) = \frac{1}{k},\ i = 1, ..., k$$
$$\mathrm{E}(Y) = \frac{k+1}{2},\ \mathrm{Var}(Y) = \frac{k^2-1}{12}$$

Binomial Successes in independent trials

$$Y \sim \mathrm{Bin}(n, \pi) \text{ with } n \in \mathbb{N}, \pi \in [0,1],\ y \in \{0, ..., n\}$$
$$P(Y = y|\lambda) = \binom{n}{y}\pi^k(1-\pi)^{n-y}$$
$$\mathrm{E}(Y|\pi, n) = n\pi,\ \mathrm{Var}(Y|\pi, n) = n\pi(1-\pi)$$

Poisson Counting model for rare events

only one event at a time, no autocorrelation, mean number of events over time is constant and proportional to length of the considered time interval

$$Y \sim \mathrm{Po}(\lambda) \text{ with } \lambda \in [0, +\infty],\ y \in \mathbb{N}_0$$
$$P(Y = y|\lambda) = \frac{\lambda^y exp^{-\lambda}}{y!}$$
$$\mathrm{E}(Y|p) = \lambda,\ \mathrm{Var}(Y|p) = \lambda$$

The model tends to overestimate the variance (Overdispersion). *Approximation* of the Binomial for small p

Geometric

$$Y \sim \mathrm{Geom}(\pi) \text{ with } \pi \in [0,1],\ y \in \mathbb{N}_0$$
$$P(Y = y|\pi) = \pi(1-\pi)^{y-1}$$
$$\mathrm{E}(Y|\pi) = \frac{1}{\pi},\ \mathrm{Var}(Y|\pi) = \frac{1-\pi}{\pi^2}$$

Negative Binomial

$$Y \sim \mathrm{NegBin}(\alpha, \beta) \text{ with } \alpha, \beta \geq 0,\ y \in \mathbb{N}_0$$
$$P(Y = y|\alpha, \beta) = \binom{\alpha+y-1}{\alpha-1}\left(\frac{\beta}{\beta-1}\right)^\alpha\left(\frac{1}{\beta+1}\right)^y$$
$$\mathrm{E}(Y|\alpha, \beta) = \frac{\alpha}{\beta},\ \mathrm{Var}(Y|\alpha, \beta) = \frac{\alpha}{\beta^2}(\beta+1)$$

2.4.2 Continuous Distributions

Continuous Uniform

$$Y \sim \mathrm{U}(a, b) \text{ with } \alpha, \beta \in \mathbb{R}, a \leq b,\ y \in [a, b]$$
$$p(y|a, b) = \frac{1}{b-a}$$
$$\mathrm{E}(Y|a, b) = \frac{a+b}{2},\ \mathrm{Var}(Y|a, b) = \frac{(b-a)^2}{12}$$

Univariate Normal symmetric with μ and σ^2

$$Y \sim \mathrm{N}(\mu, \sigma^2) \text{ with } \mu \in \mathbb{R}, \sigma^2 > 0,\ y \in \mathbb{R}$$
$$p(y|\mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2}}\exp\left(-\frac{(y-\mu)^2}{2\sigma^2}\right)$$
$$\mathrm{E}(Y|\mu, \sigma^2) = \mu,\ \mathrm{Var}(Y|\mu, \sigma^2) = \sigma^2$$

Multivariate Normal symmetric mit μ_i and Σ

$$Y \sim \mathrm{N}(\mu, \Sigma) \text{ with } \mu \in \mathbb{R}^d, \Sigma \in \mathbb{R}^{d \times d} s.p.d.,\ y \in \mathbb{R}^d$$
$$p(y|\mu, \Sigma) = (2\pi)^{-\frac{d}{2}}\det(\Sigma)^{-\frac{1}{2}}\exp\left(-\frac{1}{2}(y-\mu)^T\Sigma^{-1}(y-\mu)\right)$$
$$\mathrm{E}(Y|\mu, \Sigma) = \mu,\ \mathrm{Var}(Y|\mu, \Sigma) = \Sigma$$

Log-Normal

$$Y \sim \mathrm{LogN}(\mu, \sigma^2) \text{ eith } \mu \in \mathbb{R}, \sigma^2 > 0,\ y > 0$$
$$p(y|\mu, \sigma^2) = \frac{1}{\sqrt{2\pi\sigma^2 y}}\exp\left(-\frac{(\log y - \mu)^2}{2\sigma^2}\right)$$
$$\mathrm{E}(Y|\mu, \sigma^2) = \exp(\mu + \frac{\sigma^2}{2}),$$
$$\mathrm{Var}(Y|\mu, \sigma^2) = \exp(2\mu + \sigma^2)(\exp(\sigma^2) - 1)$$

Relationship: $\log(Y) \sim \mathrm{N}(\mu, \sigma^2) \Rightarrow Y \sim \mathrm{LogN}(\mu, \sigma^2)$

non-standardized Student's t statistical Tests for μ with unknown (estimated) variance and ν degrees of freedom

$$Y \sim \mathrm{t}_\nu(\mu, \sigma^2) \text{ with } \mu \in \mathbb{R}, \sigma^2, \nu > 0,\ y \in \mathbb{R}$$
$$p(y|\mu, \sigma^2, \nu) = \frac{\Gamma\left(\frac{\nu+1}{2}\right)}{\Gamma(\frac{\nu}{2})\Gamma(\sqrt{\nu\pi}\sigma)}\left(1 + \frac{(y-\mu)^2}{\nu\sigma^2}\right)^{-\frac{\nu+1}{2}}$$
$$\mathrm{E}(Y|\mu, \sigma^2, \nu) = \mu \text{ for } \nu > 1,$$
$$\mathrm{Var}(Y|\mu, \sigma^2, \nu) = \sigma^2\frac{\nu}{\nu-2} \text{ for } \nu > 2$$

Relationship: $Y|\theta \sim \mathrm{N}(\mu, \frac{\sigma^2}{\theta}),\ \theta \sim \mathrm{Ga}(\frac{\nu}{2}, \frac{\nu}{2}) \Rightarrow Y \sim \mathrm{t}_\nu(\mu, \sigma)$
$t_\nu(\mu, \sigma^2)$ has heavier tails then the normal distribution.
$t_\infty(\mu, \sigma^2)$ approaches $\mathrm{N}(\mu, \sigma^2)$.

Beta

$$\begin{aligned}
&Y \sim \mathrm{Be}(a,b) \text{ with } a,b>0,\ y\in[0,1]\\
&p(y|a,b)=\frac{\Gamma\left(a+b\right)}{\Gamma(a)\Gamma(b)}y^{a-1}(1-y)^{b-1}\\
&\mathrm{E}(Y|a,b)=\frac{a}{a+b},\\
&\mathrm{Var}(Y|a,b)=\frac{ab}{\left(a+b\right)^{2}\left(a+b+1\right)},\\
&\mathrm{mod}(Y|a,b)=\frac{a-1}{a+b-2}\text{ f'ur } a,b>1
\end{aligned}$$

Gamma

$$\begin{aligned}
&Y \sim \mathrm{Ga}(a,b) \text{ with } a,b>0,\ y>0\\
&p(y|a,b)=\frac{b^{a}}{\Gamma(a)}y^{a-1}\exp(-by)\\
&\mathrm{E}(Y|a,b)=\frac{a}{b},\\
&\mathrm{Var}(Y|a,b)=\frac{a}{b^{a}},\\
&\mathrm{mod}(Y|a,b)=\frac{a-1}{b}\text{ f'ur } a\geq 1
\end{aligned}$$

Inverse-Gamma

$$\begin{aligned}
&Y \sim \mathrm{IG}(a,b) \text{ with } a,b>0,\ y>0\\
&p(y|a,b)=\frac{b^{a}}{\Gamma(a)}y^{-a-1}\exp(-\frac{b}{y})\\
&\mathrm{E}(Y|a,b)=\frac{b}{a-1}\text{ f'ur } a>1,\\
&\mathrm{Var}(Y|a,b)=\frac{b^{2}}{(a-1)^{2}(a-2)}\text{ f'ur } a\geq 2,\\
&\mathrm{mod}(Y|a,b)=\frac{b}{a+1}
\end{aligned}$$

Relationship: $Y^{-1} \sim \mathrm{Ga}(a,b) \Leftrightarrow Y \sim \mathrm{IG}(a,b)$

Exponential Time between Poisson events

$$\begin{aligned}
&Y \sim \mathrm{Exp}(\lambda) \text{ with } \lambda>0,\ y\geq 0\\
&p(y|\lambda)=\lambda\exp(-\lambda y)\\
&\mathrm{E}(Y|\lambda)=\frac{1}{\lambda},\ \mathrm{Var}(Y|\lambda)=\frac{1}{\lambda^{2}}
\end{aligned}$$

Chi-Squared squared standard normal random variables with ν degrees of freedom

$$\begin{aligned}
&Y \sim \chi^{2}(\nu) \text{ with } \nu>0,,\ y\in\mathbb{R}\\
&p(y|\nu)=\frac{y^{\frac{\nu}{2}-1}e^{-\frac{y}{2}}}{2^{\frac{\nu}{2}}\Gamma\left(\frac{\nu}{2}\right)}\\
&\mathrm{E}(Y|\nu)=\nu,\ \mathrm{Var}(Y|\nu)=2\nu
\end{aligned}$$

2.4.3 Exponential Family

Definition
The exponential family comprises all distributions, whose density can be written as follows:

$$f_Y(y,\theta)=\exp^{t^T(y)\theta-\kappa(\theta)}h(y)$$

with $h(y)\geq 0$, $t(y)$ vector of the canonical statistic, θ as parameter and $\kappa(\theta)$ the normalising constant.

Normalising Constant

$$\begin{aligned}
1&=\int\exp^{t^T(y)\theta}h(y)dy\exp^{-\kappa(\theta)}\\
\Leftrightarrow\kappa(\theta)&=\log\int\exp^{t^T(y)\theta}h(y)dy
\end{aligned}$$

$\kappa(\theta)$ is the cumulant generating function, therefore $\frac{\partial\kappa(\theta)}{\partial\theta}=\mathrm{E}(t(Y))$ and $\frac{\partial^2\kappa(\theta)}{\partial\theta^2}=\mathrm{Var}(t(Y))$

Members

- **Poisson**
- **Geometric**
- **Exponential**
- **Normal** $t(y)=\left(-\frac{y^2}{2},y\right)^T$, $\theta=\left(\frac{1}{\sigma^2},\frac{\mu}{\sigma^2}\right)^T$, $h(y)=\frac{1}{\sqrt{2\pi}}$, $\kappa(\theta)=\frac{1}{2}\left(-\log\frac{1}{\sigma^2}+\frac{\mu^2}{\sigma^2}\right)$
- **Gamma**
- **Chi-Squared**
- **Beta**

2.5 Limit Theorems

Law of Large Numbers

Central Limit Theorem

$$Z_n\xrightarrow{d}\mathrm{N}(0,\sigma^2)$$

with $Z_n=\sum_{i=1}^n\frac{Y_i}{\sqrt{n}}$ and Y_i i.i.d. with expectation 0 and variance σ^2

Proof:
For normal random variables $Z \sim \mathrm{N}(\mu, \sigma^2)$: $K_Z(t) = \mu t + \frac{1}{2}\sigma^2 t^2$. The first two derivatives $\left.\frac{\partial^k K_Z(t)}{\partial t^k}\right|_{t=0}$ are μ and σ. All other moments are zero.
For $Z_n = (Y_1 + Y_2 + ... + Y_n)/\sqrt{n}$:

$$\begin{aligned}
M_{Z_n}(t) &= \mathrm{E}\left(e^{t(Y_1+Y_2+...+Y_n)/\sqrt{n}}\right) \\
&= \mathrm{E}\left(e^{tY_1/\sqrt{n}} \cdot e^{tY_2/\sqrt{n}} \cdot ... \cdot e^{tY_n/\sqrt{n}}\right) \\
&= \mathrm{E}\left(e^{tY_1/\sqrt{n}}\right) \mathrm{E}\left(e^{tY_2/\sqrt{n}}\right) ... \mathrm{E}\left(e^{tY_n/\sqrt{n}}\right) \\
&= M_Y^n(t/\sqrt{n})
\end{aligned}$$

Analoguously: $K_{Z_n}(t) = nK_Y(t/\sqrt{n})$.

$$\begin{aligned}
\left.\frac{\partial K_{Z_n}(t)}{\partial t}\right|_{t=0} &= \frac{n}{\sqrt{n}} \left.\frac{\partial K_Y(t)}{\partial t}\right|_{t=0} = \sqrt{n}\mu \\
\left.\frac{\partial^2 K_{Z_n}(t)}{\partial t^2}\right|_{t=0} &= \frac{n}{n} \left.\frac{\partial^2 K_Y(t)}{\partial t^2}\right|_{t=0} = \sigma^2
\end{aligned}$$

Using the Taylor Expansion, we can write$K_{Z_n}(t) = 0 + \sqrt{n}\mu t + \frac{1}{2}\sigma^2 t^2 + ...$, where the terms in ... are tending towards 0 as $n \to \infty$.
Therefore: $K_{Z_n}(t) \overset{n\to\infty}{\longrightarrow} K_Z(t)$ with $Z \sim \mathrm{N}(\sqrt{n}\mu, \sigma^2)$.

3 Inference

3.1 Method of Moments

Die theoretischen Momente werden durch die empirischen geschätzt:

$$\mathrm{E}_{\hat{\theta}_{MM}}(Y^k) = m_k(y_1, ..., y_n)$$

Für die Exponentialfamilie gilt: $\hat{\theta}_{MM} = \hat{\theta}_{ML}$

3.2 Loss Functions

Verlust

$$\mathcal{L} : \mathcal{T} \times \Theta \to \mathbb{R}^+$$

mit Parameterraum $\Theta \subset \mathbb{R}$, $t \in \mathcal{T}$ mit $t : \mathbb{R}^n \to \mathbb{R}$ eine Statistik, die den Parameter θ schätzt. Es gilt: $\mathcal{L}(\theta, \theta) = 0$

- **absoluter Verlust (L1)**: $\mathcal{L}(t, \theta) = |t - \theta|$
- **quadratischer Verlust (L2)**: $\mathcal{L}(t, \theta) = (t - \theta)^2$

Da θ unbekannt ist, ist der Verlust eine theoretische Größe.
Zudem ist er die Realisation einer Zufallsvariable, da er von einer konkreten Stichprobe abhängt.

Risiko

$$\begin{aligned}
R(t(.), \theta) &= \mathrm{E}_\theta\left(\mathcal{L}(t(Y_1, ..., Y_n), \theta)\right) \\
&= \int_{-\infty}^{\infty} \mathcal{L}(t(Y_1, ..., Y_n), \theta) \prod_{i=1}^{n} f(y_i; \theta) dy_i
\end{aligned}$$

Minimax-Regel
Das Risiko beruht immer noch auf dem wahren Parameter θ.
Vorsichtige Schätzung: Wähle θ so, dass das Risiko maximal wird, und danach $t(.)$ so, dass das Risiko minimiert wird:

$$\hat{\theta}_{minimax} = \arg\min_{t(.)} \left(\max_{\theta \in \Theta} R(t(.); \theta)\right)$$

Es wird der Worst Case minimiert.

Mean Squared Error (MSE)

$$\begin{aligned}
MSE(t(.), \theta) &= \mathrm{E}_\theta\left(\{t(Y) - \theta\}^2\right) \\
&= \mathrm{Var}_\theta\left(t(Y_1, ..., Y_n)\right) + Bias^2((t(.); \theta)
\end{aligned}$$

mit $Bias(t(.); \theta) = \mathrm{E}_\theta\left(t(Y_1, ..., Y_n)\right) - \theta$

Proof:
Sei $\mathcal{L}(t, \theta) = (t - \theta)^2$

$$\begin{aligned}
R(t(.), \theta) &= \mathrm{E}_\theta(\{t(Y) - \theta\}^2) \\
&= \mathrm{E}_\theta(\{t(Y) - \mathrm{E}_\theta(t(Y)) + \mathrm{E}_\theta(t(Y)) - \theta\}^2) \\
&= \mathrm{E}_\theta(\{t(Y) - \mathrm{E}_\theta(t(Y))\}^2) + \mathrm{E}_\theta(\{\mathrm{E}_\theta(t(Y)) - \theta\}^2) \\
&\quad + 2\mathrm{E}_\theta(\{t(Y) - \mathrm{E}_\theta\left(t(Y)\right)\}\{\mathrm{E}_\theta(t(Y)) - \theta\}) \\
&= \mathrm{Var}_\theta(t(Y_1, ..., Y_n)) + Bias^2((t(.); \theta) + 0
\end{aligned}$$

Cramér-Rao-Ungleichung

$$MSE(\hat{\theta},\theta) \geq Bias^2(\hat{\theta},\theta) + \frac{\left(1+\frac{\partial Bias(\hat{\theta},\theta)}{partial\theta}\right)^2}{I(\theta)}$$

Proof:
Für ungebiaste Schätzer: $\theta = \mathrm{E}_\theta(\hat{\theta}) = \int t(y)f(y;\theta)dy$

$$\begin{aligned}
1 &= \int t(y)\frac{\partial f(y;\theta)}{\partial\theta}dy \\
&= \int t(y)\frac{\partial \log f(y;\theta)}{\partial\theta}f(y;\theta)dy \\
&= \int t(y)s(y;\theta)f(y;\theta)dy \\
&= \int (t(y)-\theta)\,(s(\theta;y)-0)\,f(y;\theta)dy && \overset{\text{1. Bartlett-Gleichung}}{\mathrm{E}_\theta\,(s(\theta;y))=0} \\
&= \mathrm{Cov}_\theta\,(t(Y);s(\theta;Y)) \\
&\geq \sqrt{\mathrm{Var}_\theta(t(Y))}\sqrt{\mathrm{Var}_\theta(s(\theta;Y))} && \text{Cauchy-Schwarz} \\
&= \sqrt{MSE(t(Y);\theta)}\sqrt{I(\theta)}
\end{aligned}$$

Kullback-Leibler-Divergenz Vergleich von Verteilungen

$$KL(t,\theta) = \int_{-\infty}^{\infty} \log\frac{f(\tilde{y};\theta)}{f(\tilde{y};t)}f(\tilde{y};\theta)d\tilde{y}$$

Die KL-Divergenz ist keine Distanz, da sie nicht symmetrisch ist. Sie ist 0 für $t=\theta$ und größer/gleich 0 sonst.

Proof:
Folgt aus $\log(x) \leq x-1 \forall x \geq 0$, mit Gleichheit für $x=1$.

$R_{KL}(t(.),\theta)$ wird durch den MSE approximiert.

Proof:

$$\begin{aligned}
&R_{KL}(t(.),\theta) = \\
&= \int_{-\infty}^{\infty} \mathcal{L}_{KL}(t(Y_1,...,Y_n),\theta)\prod_{i=1}^n f(y_i;\theta)dy_i \\
&= \int\int \log\frac{f(\tilde{y};\theta)}{f(\tilde{y};t)}f(\tilde{y};\theta)d\tilde{y}\prod_{i=1}^n f(y_i;\theta)dy_i \\
&= \int\int (\log f(\tilde{y};\theta) - \log f(\tilde{y};t))\,f(\tilde{y};\theta)d\tilde{y} - \prod_{i=1}^n f(y_i;\theta)dy_i \\
&\approx -\int \underbrace{\left(\int \frac{\partial \log f(\tilde{y};\theta)}{\partial\theta}f(\tilde{y};\theta)d\tilde{y}\right)}_{0}(t-\theta)\prod_{i=1}^n f(y_i;\theta)dy_i \\
&+\frac{1}{2}\int \underbrace{\left(-\int \frac{\partial^2 \log f(\tilde{y};\theta)}{\partial\theta^2}f(\tilde{y};\theta)d\tilde{y}\right)}_{I(\theta)}(t-\theta)^2\prod_{i=1}^n f(y_i;\theta)dy_i
\end{aligned}$$

Wobei der letzte Schritt durch die Taylorreihe approximiert wurde: $\log f(\tilde{y},t) \approx \log f(\tilde{y},\theta) + \frac{\partial \log f(\tilde{y},\theta)}{\partial\theta}(t-\theta) + \frac{1}{2}\frac{\partial^2 \log f(\tilde{y},\theta)}{\partial\theta^2}(t-\theta)^2$

3.3 Maximum Likelihood (ML)

Voraussetzungen

- $Y_i \sim f(y;\theta)$ *i.i.d.*
- $\theta \in \mathbb{R}^p$
- $f(.;\theta)$ Fisher-regulär:
  - $\{y : f(y;\theta > 0)\}$ unabhängig von θ
  - Möglicher Parameterraum Θ ist offen
  - $f(y;\theta)$ zweimal differenzierbar
  - $\int \frac{\partial}{\partial\theta}f(y;\theta)dy = \frac{\partial}{\partial\theta}\int f(y;\theta)dy$

Zentrale Funktionen

- **Likelihood** $L(\theta;y_1,...,y_n)$: $\prod_{i=1}^n f(y_i;\theta)$
- **log-Likelihood** $l(\theta;y_1,..y_n)$:
  $\log L(\theta;y_1,...,y_n) = \sum_{i=1}^n \log f(y_i;\theta)$
- **Score** $s(\theta;y_1,...,y_n)$: $\frac{\partial l(\theta;y_1,..y_n)}{\partial\theta}$
- **Fisher-Information** $I(\theta)$: $-\mathrm{E}_\theta\left(\frac{\partial s(\theta;Y)}{\partial\theta}\right)$
- **beobachtete Fisher-Information** $I_{obs}(\theta)$:
  $-\mathrm{E}_\theta\left(\frac{\partial s(\theta;y)}{\partial\theta}\right)$

Eigenschaften der Score-Funktion

erste Bartlett-Gleichung:

$$\mathrm{E}\,(s(\theta;Y)) = 0$$

Proof:

$$\begin{aligned}
1 &= \int f(y;\theta)dy \\
0 = \frac{\partial 1}{\partial\theta} &= \int \frac{\partial f(y;\theta)}{\partial\theta}dy = \int \frac{\partial f(y;\theta)/\partial\theta}{f(y;\theta)}f(y;\theta)dy \\
&= \int \frac{\partial}{\partial\theta}\log f(y;\theta)f(y;\theta)dy = \int s(\theta;y)f(y;\theta)dy
\end{aligned}$$

zweite Bartlett-Gleichung:

$$\mathrm{Var}_\theta\,(s(Y;\theta)) = \mathrm{E}_\theta\left(-\frac{\partial^2 logf(Y;\theta)}{\partial\theta^2}\right) = I(\theta)$$

Proof:

$$\begin{aligned}
0 = \frac{\partial 0}{\partial\theta} &= \frac{\partial}{\partial\theta}\int \frac{\partial}{\partial\theta}\log f(y;\theta)f(y;\theta)dy && \text{siehe oben} \\
&= \int\left(\frac{\partial^2}{\partial\theta^2}\log f(y;\theta)\right)f(y;\theta)dy \\
&\quad + \int \frac{\partial \log f(y;\theta)}{\partial\theta}\frac{\partial f(y;\theta)}{\partial\theta}dy \\
&= \mathrm{E}_\theta\left(\frac{\partial^2}{\partial\theta^2}\log f(Y;\theta)\right) \\
&\quad + \int \frac{\partial \log f(y;\theta)}{\partial\theta}\frac{\partial \log f(y;\theta)}{\partial\theta}f(y;\theta)dy
\end{aligned}$$

$$\Leftrightarrow \mathrm{E}_\theta\,(s(\theta;Y)s(\theta;Y)) = \mathrm{E}_\theta\left(-\frac{\partial^2}{\partial\theta^2}\log f(Y;\theta)\right)$$

Bartletts zweite Gleichung gilt dann, weil $\mathrm{E}\,(s(\theta;Y)) = 0$

ML-Schätzer

$$\hat{\theta}_{ML} = \arg\max\, l(\theta; y_1, ...y_n)$$

für Fisher-reguläre Verteilungen: $\hat{\theta}_{ML}$ hat asymptotisch die kleinstmögliche Varianz, gegeben durch die Cramér-Rao-Ungleichung, $s\left(\hat{\theta}_{ML}; y_1, ..., y_n\right) = 0$
$\hat{\theta} \overset{a}{\sim} \mathrm{N}\left(\theta, I^{-1}(\theta)\right)$
Der ML-Schätzer ist invariant: $\hat{\gamma} = g(\hat{\theta})$ wenn $\gamma = g(\theta)$.

Proof:
$\gamma = g(\theta) \Leftrightarrow \theta = g^{-1}(\gamma)$
Für die Loglikelihood von γ an der Stelle $\hat{\theta}$ gilt:

$$\frac{\partial l(g^{-1}(\hat{\gamma}))}{\partial \gamma} = \frac{\partial g^{-1}(\gamma)}{\partial \gamma} \underbrace{\frac{\partial l(\hat{\theta})}{\partial \theta}}_{=0} = 0$$

Die Fisher-Information ist dann $\frac{\partial \theta}{\partial \gamma} I(\theta) \frac{\partial \theta}{\partial \gamma}$

Proof:

$$I_\gamma(\gamma) = -\mathrm{E}\left(\frac{\partial^2 l(g^{-1}(\hat{\gamma}))}{\partial \gamma^2}\right) = -\mathrm{E}\left(\frac{\partial}{\partial \gamma}\left(\frac{\partial g^{-1}(\gamma)}{\partial \gamma}\frac{\partial l(\theta)}{\partial \theta}\right)\right)$$
$$= -\mathrm{E}\left(\underbrace{\frac{\partial^2 g^{-1}(\gamma)}{\partial \gamma}\frac{\partial l(\theta)}{\partial \theta}}_{\text{Erwartungswert } 0} + \frac{\partial g^{-1}(\gamma)}{\partial \gamma}\frac{\partial^2 l(\theta)}{\partial \theta^2}\frac{\partial g^{-1}(\gamma)}{\partial \gamma}\right)$$
$$= \frac{\partial g^{-1}(\gamma)}{\partial \gamma} I(\theta) \frac{\partial g^{-1}(\gamma)}{\partial \gamma} = \frac{\partial \theta}{\partial \gamma} I(\theta) \frac{\partial \theta}{\partial \gamma}$$

Delta-Regel: $\gamma \overset{a}{\sim} \mathrm{N}(\hat{\gamma}, \frac{\partial \theta}{\partial \gamma} I^{-1}(\theta) \frac{\partial \theta}{\partial \gamma}$

Numerical computation of the ML estimate Fisher-Scoring as statistical version of the Newton-Raphson procedure

1. Initialize $\theta_{(0)}$
2. Repeat: $\theta_{(t+1)} := \theta_{(t)} + I^{-1}(\theta_{(t)}) s(\theta_{(t)}; y)$
3. Stop if $\|\theta_{(t+1)} - \theta_{(t)}\| < \tau$; return $\hat{\theta}_{ML} = \theta_{(t+1)}$

Proof:

$$0 = s(\hat{\theta}_{ML}; y) \underset{Series}{\overset{Taylor}{\approx}} s(\theta; y) + \frac{\partial s(\theta; y)}{\partial \theta}(\hat{\theta}_{ML} - \theta) \Leftrightarrow$$
$$\hat{\theta}_{ML} \approx \theta - \left(\frac{\partial s(\theta; y)}{\partial \theta}\right)^{-1} s(\theta; y) \approx \theta - I^{-1}(\theta) s(\theta; y)$$

As $\frac{\partial s(\theta; y)}{\partial \theta}$ is often complicated, its expectation $I(\theta)$ is used.

The second part in 2 can be weighted with a step size δ or $\delta(t) \in (0, 1)$, e. g. to ensure convergence.
If $I(\theta)$ can't be analytically derived, simulation from $f(y; \theta_{(t)})$ can be used. For the exponential family, step 2 then changes to $\theta_{(t+1)} := \theta_{(t)} + \hat{\mathrm{Var}}_{\theta_{(t)}}(t(Y))^{-1} \mathrm{E}_{\theta_{(t)}}(t(Y))$ as the ML estimate is the expectation.

Log Likelihood Ratio

$$lr(\theta, \hat{\theta}) := l(\hat{\theta}) - l(\theta) = \log \frac{L(\hat{\theta})}{L(\theta)}$$

with $2 \cdot lr(\theta, \hat{\theta}) \overset{a}{\sim} \chi_1^2$

Proof:

$$l(\theta) \underset{Series}{\overset{Taylor}{\approx}} l(\hat{\theta}) + \underbrace{\frac{\partial l(\hat{\theta})}{\partial \theta}}_{=0}(\theta - \hat{\theta}) + \frac{1}{2} \underbrace{\frac{\partial^2 l(\hat{\theta})}{\partial \theta^2}}_{\approx I^{-1}(\theta) s(\theta; Y)} (\underbrace{\theta - \hat{\theta}}_{\approx -I(\theta)})^2$$
$$\approx l(\hat{\theta}) - \frac{1}{2}\frac{s^2(\theta, Y)}{I(\theta)}$$

$s(\theta, Y)$ is asymptotically normal.

If $\theta \in \mathbb{R}^p$ the corresponding distribution is χ_p^2.

3.4 Sufficiency und Consistency

Suffizienz
Eine Statistik $t(y_1, ..., y_n)$ ist suffizient für θ, wenn die bedingte Verteilung $f(y_1, ..., y_n | t_0 = t(y_1, ..., y_n); \theta)$ unabhängig von θ ist.

Neyman-Kriterium:

$$t(Y_1, ..., Y_n) \text{ suffizient } \Leftrightarrow f(y; \theta) = h(y) g\left(t(y); \theta\right)$$

Proof:
"$\Rightarrow$":

$$f(y; \theta) = \underbrace{f(y | t = t(y); \theta)}_{h(y)} \underbrace{f_t(t | y; \theta)}_{g(t(y); \theta)}$$

"$\Leftarrow$":

$$f_t(t; \theta) = \int_{t = t(y)} f(y; \theta) dy = \int_{t = t(y)} h(y) g(t; \theta) dy$$

Damit:

$$f\left(y | t = t(y); \theta\right) = \frac{f(y, t = t(y); \theta)}{f_t(t, \theta)} = \begin{cases} \frac{h(y) g(t; \theta)}{g(t; \theta)} & t = t(y) \\ 0 & \text{sonst} \end{cases}$$

Minimalsuffizienz:
$t(.)$ ist suffizient und $\forall\, \tilde{t}(.)\, \exists\, h(.)$ s.t. $t(y) = h(\tilde{t}(y))$

(schwache) Konsistenz

$$MSE(\hat{\theta}, \theta) \overset{n \to \infty}{\longrightarrow} 0 \Rightarrow \hat{\theta} \text{ konsistent}$$

3.5 Confidence Intervals

Definition

$$[t_l(Y), t_r(Y)] \text{ Konfidenzintervall}$$

$$\Leftrightarrow$$

$$P_\theta\left((t_l(Y) \leq \theta \leq t_r(Y)\right) \geq 1-\alpha$$

mit $1-\alpha$ Konfidenzlevel und α Signifikanzlevel

Pivotale Statistik

$$g(Y;\theta) \text{ pivotal}$$

$$\Leftrightarrow$$

$$\text{Verteilung von } g(Y;\theta) \text{ unabhängig von } \theta$$

Approximativ pivotale Statistik

$$g(\hat{\theta};\theta) = \frac{\hat{\theta}-\theta}{\sqrt{\mathrm{Var}(\hat{\theta})}} \overset{\alpha}{\sim} \mathrm{N}(0,1)$$

mit $\hat{\theta} = t(Y) \overset{\alpha}{\sim} \mathrm{N}(\theta, \mathrm{Var}(\hat{\theta})$

$$KI = \left[\hat{\theta} - z_{1-\frac{\alpha}{2}}\sqrt{\mathrm{Var}(\hat{\theta})}, \hat{\theta} + z_{1-\frac{\alpha}{2}}\sqrt{\mathrm{Var}(\hat{\theta})}\right]$$

Proof:
$1-\alpha \approx P\left(z_{\frac{\alpha}{2}} \leq \frac{\hat{\theta}-\theta}{\sqrt{\mathrm{Var}(\hat{\theta})}} \leq z_{1-\frac{\alpha}{2}}\right)$

4 Statistical Hypothesis Testing

4.1 Significance, Relevance, p-Value

Significance Test
Assuming two states H_0 and H_1 and two corresponding decisions "H_0" and "H_1", a decision rule (a threshold $c \in \mathbb{R}$ for the test statistic $T(X)$) is constructed s. t.:

$$P(\text{“}H_1\text{”}|H_0) = 1-\alpha$$

	"H_0"	"H_1"
H_0	$1-\alpha$ (correct)	α (type I error)
H_1	β (type II error)	$1-\beta$ (correct)

Power concerns the type II error

$$power = P(\text{“}H_1\text{”}|H_1) = 1-\beta$$

p-Value measures the amount of evidence against H_0

$$p-value \leq \alpha \Leftrightarrow \text{“}H_0\text{”}$$

4.2 Tests for One Sample

Normal Distribution $X_i \overset{iid}{\sim} N(\mu, \sigma^2)$

Test for μ, known σ^2 (Simple Gauss-Test)
$H_0\colon\ \mu = \mu_0 \quad vs. \quad H_1\colon\ \mu \neq \mu_0$

$$T(X) = \frac{\bar{X}-\mu_0}{\sigma} \overset{H_0}{\sim} \mathrm{N}(0,1)$$

Test for μ, unknown σ^2 (Simple t-Test)
$H_0\colon\ \mu = \mu_0 \quad vs. \quad H_1\colon\ \mu \neq \mu_0$

$$T(X) = \frac{\bar{X}-\mu_0}{\hat{\sigma}/\sqrt{n}} \overset{H_0}{\sim} t_{n-1}$$

with $\hat{\sigma} = \sqrt{\frac{1}{n-1}\sum_{i=1}^n (Y_i - \bar{Y})^2}$

ML Estimate $\hat{\theta} \overset{a}{\sim} \mathrm{N}(\theta, I^{-1}(\theta))$

Wald Test
$H_0\colon\ \theta = \theta_0 \quad vs. \quad H_1\colon\ \theta \neq \theta_0$

$$T(X) = |\hat{\theta} - \theta_0| \overset{H_0}{\sim} \mathrm{N}(0, I^{-1}(\theta_0))$$

As $\hat{\theta}$ converges to θ_0 under H_0, it can also be used to calculate the variance: $I^{-1}(\hat{\theta}$.

Score Test
$H_0\colon\ \theta = \theta_0 \quad vs. \quad H_1\colon\ \theta \neq \theta_0$

$$T(X) = |s(\theta_0; y)| \overset{H_0}{\sim} \mathrm{N}(0, I(\theta_0))$$

Advantage compared to the Wald Test: $\hat{\theta}$ does not have to be calculated.

Likelihood Ratio Test
$H_0\colon\ \theta = \theta_0 \quad vs. \quad H_1\colon\ \theta \neq \theta_0$

$$T(X) = 2(l(\hat{\theta}) - l(\theta)) \overset{H_0}{\sim} \chi^2_1$$

Neyman-Pearson Test
$H_0\colon\ \theta = \theta_0 \quad vs. \quad H_1\colon\ \theta = \theta_1$

$$T(X) = l(\theta_0) - l(\theta_1)$$

For a given significance level α, the Neyman Pearson Test is the most powerful test for comparing two estimates for θ.

Proof:

Decision rule of the NP-Test: $\varphi^* = \begin{cases} 1 & if \frac{f(y;\theta_0)}{f(y;\theta_1)} \leq \mathrm{e}^c \\ 0 & \text{otherwise} \end{cases}$

Need to show: $P(\varphi(Y){=}1|\theta_1) \leq P(\varphi^*(Y){=}1|\theta_1)\ \forall\varphi$

$P(\varphi^*{=}1|\theta_1) - P(\varphi{=}1|\theta_1) =$

$$
\begin{aligned}
&= \int \{\varphi^*(y) - \varphi(y)\} f(y;\theta_1) dy \\
&\geq \frac{1}{\mathrm{e}^c} \int_{\varphi^*=1} \{\varphi^*(y) - \varphi(y)\} f(y;\theta_0) dy \qquad f(y;\theta_1) \geq \frac{f(y;\theta_0)}{\mathrm{e}^c} \\
&+ \frac{1}{\mathrm{e}^c} \int_{\varphi^*=0} \{\varphi^*(y) - \varphi(y)\} f(y;\theta_0) dy \qquad f(y;\theta_1) \leq \frac{f(y;\theta_0)}{\mathrm{e}^c} \\
&= \frac{1}{\mathrm{e}^c} \int \{\varphi^*(y) - \varphi(y)\} f(y;\theta_0) dy = 0
\end{aligned}
$$

As $\alpha = \int \varphi^*(y) f(y;\theta_0) dy = \int \varphi(y) f(y;\theta_0) dy$

4.3 Tests for Two Samples

4.4 Tests for Goodness of Fit

Discrete (Chi-Squared)

$H_0\colon\ X_i \sim F_0 \quad vs. \quad H_1\colon\ X_i \sim F \neq F_0$

$$T(X) = \sum_{k=1}^{K} \frac{(n_k - l_k)^2}{l_k} \overset{H_0}{\sim} \chi^2_{K-1-p}$$

with the following contingency table:

	1	2		K
observed	n_1	n_2	...	n_K
expected under H_0	l_1	l_2	...	l_K

$l_k > 5$ and $l_k > n - 5$ for the χ^2_{K-1-p}-distribution to hold,
F_0 needs to be known, but its p parameters can be estimated.
The test can be applied to discretized continuous variables.

Continuous (Kolmogorov-Smirnov Test)

$H_0\colon\ X_i \sim F_0 \quad vs. \quad H_1\colon\ X_i \sim F \neq F_0$

$$T(X) = \sup_x |F_n(x) - F(x;\theta)| \overset{H_0}{\sim} KS$$

with the distribution function $F(x;\theta)$ and the empirical counterpart $F_n(x) = \frac{1}{n}\sum_{i=1}^n \mathbb{1}_{\{X_i \leq x\}}$

Proof:

$P(\sup_x |F_n(x) - F(x;\theta)| \leq t) =$

$$= P(\sup_y |F^{-1}(y;\theta) - x| \leq t) \qquad \substack{x\in[0,1],\ x=F^{-1}(y;\theta) \\ F(F^{-1}(y;\theta);\theta)=y}$$

$$\overset{*}{=} P(\sup_y |\frac{1}{n}\sum_{i=1}^n \mathbb{1}_{\{U_i \leq y\}} - y| \leq t) \qquad \text{with } U_i \sim U(0,1)$$

$$^*F_n(F^{-1}(y;\theta)) = \frac{1}{n}\sum_{i=1}^n \mathbb{1}_{\{X_i \leq F^{-1}(y;\theta)\}} = \frac{1}{n}\sum_{i=1}^n \mathbb{1}_{\{F(y;\theta) \leq y\}}$$

For an estimated parameter the distribution of $T(X)$ is not independent of F_0: $T(X) \overset{H_0}{\sim} KS$ only holds asymptotically.

4.5 Multiple Tests

5 Regression

5.1 Assumptions

5.2 Procedure

5.2.1 Ordinary Least Squares (OLS)

KQ-Schätzer (Einfachregression)

$$\hat{\beta}_1 = \frac{Cov(x,y)}{Var(x)} = \frac{S_{xy}}{S_{xx}} = \frac{S_{xy}}{\sqrt{S_{xx}S_{yy}}} \cdot \sqrt{\frac{S_{yy}}{S_{xx}}} = r\sqrt{\frac{S_{yy}}{S_{xx}}}$$

Proof:
$Cov(x,y) = Cov(x, \hat{\beta}_0 = \bar{y} - \hat{\beta}_1\bar{x}) = \hat{\beta}_1 Var(x)$
$\iff \hat{\beta}_1 = \frac{Cov(x,y)}{Var(x)}$

$$\hat{\beta}_0 = \bar{y} - \hat{\beta}_1\bar{x}$$

Proof:
$E[y] = E\left[\hat{\beta}_0 + \hat{\beta}_1 x + \hat{e}\right] \iff \hat{\beta}_0 = E[y] - \hat{\beta}_1 E[x]$

5.3 Model

5.3.1 Simple Linear Regression

Theoretisches Modell

$$y_i = \beta_0 + \beta_1 x_i + u_i$$

Empirisches Modell

$$\hat{y}_i = \hat{\beta}_0 + \hat{\beta}_1 x_i + e_i$$

Eigenschaften der Regressionsgeraden

$$\begin{aligned}
\hat{y}_i &= \hat{\beta}_0 + \hat{\beta}_1 x_i = \bar{y} + \hat{\beta}_1(x_i - \bar{x}) \\
\hat{e}_i &= y_i - \hat{y}_i = y_i - (\hat{\beta}_0 + \hat{\beta}_1 x_i) \\
&= y_i - (\bar{y} + \hat{\beta}_1(x_i - \bar{x})) \\
\sum_{i=1}^{n} \hat{e}_i &= \sum_{i=1}^{n} y_i - \sum_{i=1}^{n} \bar{y} - \hat{\beta}_1 \sum_{i=1}^{n}(x_i - \bar{x}) \\
&= n\bar{y} - n\bar{y} - \hat{\beta}_1(n\bar{x} - n\bar{x}) = 0 \\
\bar{\hat{y}} &= \frac{1}{n}\sum_{i=1}^{n} \hat{y}_i = \frac{1}{n}(n\bar{y} + \hat{\beta}_1(n\bar{x} - n\bar{x})) = \bar{y}
\end{aligned}$$

5.3.2 Multivariate Linear Regression

5.4 Analysis of Variances (ANOVA)

$$SS_{Total} = SS_{Explained} + SS_{Residual}$$

mit

$$\begin{aligned}
SS_{Total} &= \sum_{i=1}^{n}(y_i - \bar{y})^2 \\
SS_{Explained} &= \sum_{i=1}^{n}(\hat{y}_i - \bar{y})^2 \\
SS_{Residual} &= \sum_{i=1}^{n}(y_i - \hat{y}_i)^2 = \sum_{i=1}^{n} e_i^2 = S_{yy} - \hat{\beta}^2 S_{xx}
\end{aligned}$$

5.5 Goodness of Fit

5.5.1 Bestimmtheitsmaß

$$R^2 = \frac{SS_{Explained}}{SS_{Total}} = 1 - \frac{SS_{Residual}}{SS_{Total}} = r^2$$

Range: $0 \leq R^2 \leq 1$

6 Classification

6.1 Diskriminant Analysis (Bayes)

7 Cluster Analysis

8 Bayesian Statistics

8.1 Basics

Bayes-Formel

$$P(A|B) = \frac{P(B|A)P(A)}{P(B)} \qquad \text{für } P(A), P(B) > 0$$

oder allgemeiner:

$$\begin{aligned} f(\theta|X) &= \frac{f(X|\theta) \cdot f(\theta)}{\int f(X|\tilde{\theta}) f(\tilde{\theta}) d\tilde{\theta}} \\ &= C \cdot f(X|\theta) \cdot f(\theta) \quad \text{wähle C so, dass} \int f(\theta|X) = 1 \\ &\propto f(X|\theta) \cdot f(\theta) \end{aligned}$$

Punktschätzer

Kredibilitätsintervall

Sensitivitätsanalyse

Prädiktive Posteriori

$$f(x_Z|\mathbf{x}) = \int f(x_Z, \lambda|\mathbf{x}) d\lambda = \int f(x_Z|\lambda) p(\lambda|\mathbf{x})$$

Uninformative Priori

$f(\theta) = const.$ für $\theta > 0$, damit: $f(\theta|X) = C \cdot f(X|\theta)$
(Da $\int f(\theta) = 1$ so nicht möglich, ist das eigentlich keine Dichte)

Konjugierte Priori

Wenn die Priori- und die Posteriori-Verteilung denselben Typ hat für eine gegebene Likelihoodfunktion, so nennt man sie konjugiert.

Binomial-Beta-Modell:

- Priori $\sim Be(\alpha, \beta)$
- $X \sim Binom(n, p, k)$
- Posteriori $\sim Be(\alpha + k, \beta + n - k)$

8.2 Markov Chain / Monte Carlo
